

Computed tomography of the face or the neck

This examination can be used to study the structure, illnesses or changes in

- The face
- The paranasal sinuses
- The eye sockets or orbits
- The ears
- The jaw joints or temporomandibular joint
- The mouth and the neck.

The paranasal sinuses are air-filled spaces in the head around the nose.

The orbits are the bony structures where the eyes are situated.

When examining ears with computed tomography, images are taken of the parts located inside the skull. They cannot be seen from the outside.

If blood samples have been requested for you, please visit the laboratory 2–7 days before the examination.

Computed tomography (CT) uses X-rays to take cross-section images.

The examination is painless.

Please reserve approximately an hour for your visit.

The examination usually takes less than 30 minutes.

Patients who need urgent examinations may be examined before you.

Please see the arrival instructions or appointment letter for contact information, if you have any questions about the examination

Before the examination

- Eat and drink as usual.
- Please remove any jewelry from the head and neck area before the scans, because they cause glitches in the images. It is best to leave the jewelry at home.
- **If you are hypersensitive to iodine contrast medium**, please inform the doctor who referred you to this examination as soon as possible.

During the examination

Sometimes it is necessary to inject contrast medium into a blood vessel.

A radiologist will decide if it is necessary to use contrast medium.

If contrast medium is given during your scan, a radiographer will place a cannula into your blood vessel.

The contrast medium will be injected into the cannula.

The contrast medium makes it easier to see different tissues in the images.

The contrast medium may cause a warm sensation in your body during the scan.

You may also sense a metallic or foul taste in your mouth.

These sensations will pass quickly.

During the examination, you will lie on your back on an examination table.

The examination table will move during the scan.

It is important that you remain still during the scan because movement causes blurred images.

After the examination

You will receive the results of the examination from the doctor who treats you.

If you do not know how to find out the results, please contact the outpatient clinic or ward that referred you to this examination.

Other things to note

You will not be charged for the examination separately.

Cancel the appointment if you cannot come. If you do not cancel, you will be charged a fine.
